

# How Interxion Is Growing its Data Centre Operations with Scalable, Agile DCI Networks

When Interxion decided to expand its operations in Marseille, real-estate and power constraints led the company to build a second data centre four kilometres from the original site, and connect the two facilities with a super-fast Data Centre Interconnect (DCI) network. This allowed Interxion to create a single virtualised data centre campus, giving its clients light-speed access to subsea cables, platforms, connectivity providers and other partners at both sites.

**Challenge:** Interxion wanted to expand its data centre operations in Marseille, but no suitable real estate and power source were available next to its original location
